J. Bacteriol. 177:839-842(1955).
-1- FUNCTION: REQUIRED FOR TRANSCRIPTION ATTENUATION CONTROL IN THE TRAP OPERON. THIS TRANS-ACTING FACTOR SEEMS TO RECOGNIZE A 10 BASES NUCLEOTIDE SEQUENCE IN THE TRP LEADER TRANSCRIPT CAUSING TRANSCRIPTION TERMINATION. BINDS THE LEADER RNA ONLY IN PRESENCE
Daga R.R., Cruzado L., Jimenez J., Sanchez M., del Rey F., Benito J., Dominguez A., Revuelta J.L., Moreno S., Armstrong J., Forsburg S.L., Cerritti L., Lowe T., McCombie W.R., Paulsen I., Potashkin J., Shpakovski G.V., Ussery D., Barrell B.G., Nurse P.; "The genome sequence of Schizosaccharomyces pombe."; Nature 415:871-880(2002).

-I- MISCELLANEOUS: There are two genes for L38 in S. Pombe.
-I- SIMILARITY: BELONGS TO THE L38E FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: OLIGOMER OF 11 IDENTICAL SUBUNITS ARRANGED IN DOUGHNUT

Nature 397:176-180(1999).
-I- SIMILARITY: BELONGS TO THE L17P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   50S ribosomal protein Li7.
RPLO OR JHP1212.
RPLO OR JHP1212.
Belicobacter pylori J99 (Campylobacter pylori J99).
Bacteria: Proteobacteria: epsilon subdivision; Hellcobacter group;
WEAKLY DETECTED IN BRAIN AND TESTIS AND TO A LESSER EXTENT IN ORGANS RICH IN STRIATED MUSCLE OR VISCERAL SMOOTH MUSCLE. SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 113;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a new nerve regenerative material which contains a peptide immobilised to a base which consists of a polysaccharide gel such as alginic acid. Sequences AAB12886-B12899 represent examples of the peptides used in the nerve regeneration material. The peptide containing material causes nerve cell proliferation and also causes axonal extension. The material can be used for the treatment of central or peripheral nervous system disorders,
The present invention describes a material for medical treatment which comprises one or more peptides of the formula XADEGJIMProQY, or their salts, immobilised on a substrate: where X = H, CH3CO or CH3COLys;
A = Ser or Thr; D = ILe Val or Leu; E = Lys or Arg; G = ILe, Val or Leu; J = Gly or Ala; Q = Gly, Val or Leu; M = Gly or Ala; Q = Gly, Ala or Gly-Lys-Lys-Gly; Y = OH or NH2. Also described is an agent for cell growth promotion and/or cell adhesion promotion containing the above peptide or its salt as the active component. The peptide and its salt can be used for covering injuries, promoting adhesion of biotissues, bone reinforcing and nerve regeneration. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nerve regeneration; nerve cell proliferation; axon extension; treatment;

(1) has vulnerary and antiinflammatory activities. (1) is useful as a potent neutrophil cell chemotactic agent and for generating antibodies against the peptides, which are useful for modulating neutrophil recruitment to a wound site for enhancing or inhibiting inflammation and early effects of wound healing. Neutrophil response to (1) is specific, since monocytes and fibroblasts do not show any expression of the receptor to which (1) binds. The present sequence represents a human thrombin receptor bindin domain peptide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New synthetic neutrophil cell chemotactic peptides, useful for generating antibodies for modulating neutrophil chemotaxis in immune response and wound healing -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                          Neutrophil cell chemotactic; wound healing; inflammation; vulnerary;

Stimulating growth and repair of cartilage, useful for treating e.g. arthritis, by local administration of an agonist of non-proteolytically activated thrombin receptor
                                                                                                                                                                                                                                                                           The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-proteolytically activated thrombin receptor (NPAR). The method is used in human or veterinary medicine for the treatment of arthritic
                                                                                                                                                                                                                                                                                                                                                           joints and damage/loss of cartilage caused by traumatic injury. Also chondrocytes may be cultured in presence of NPAR agonist to provide cells for implantation at sites requiring growth/repair of cartilage. The present sequence is human thrombin peptide derivative which serves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Promoting cardiac tissue repair, stimulating revascularisation, stimulating vascular endothelial cell proliferation, and inhibiting vascular occlusion by using angiogenic thrombin derivative peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thrombin; revascularisation; vascular occlusion; tissue repair; vulnerary; vasotropic; cardiant; anglogenesis; restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombin-derived peptide used to promote cardiac tissue repair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12..23

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel synthetic peptides and antibodies which are potent chemotactic agents for neutrophils. The peptides of the invention minic the activity and role of the cleavage fragment of the proteolytically activated receptor for thrombin (PART). They are useful for stimulating or modulating neutrophil cell chemotactic migration or are useful for modulating neutrophil recultment to a wound site for an antibody. In particular, the peptides of the invention are useful for modulating neutrophil recultment to a wound site for enhancing or inhibiting inflammation and early effects in wound healing. They are also useful for modulated neutrophil chemotaxis in immune tesponse. The present sequence is high affinity receptor binding domain of human thrombin. This peptide is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cartilage repair; arthritic joint; traumatic injury;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 An exosite assay has been developed for inhibition of the catalytic cleavage of prothrombin (PTh) to thrombin (Th) by prothrombinase (I), at a site remote from the catalytic site of (I) comprises: (a) preparing a solution containing 0.05-20 mu M substrate (S), that includes a protease cleavage site and exosite-binding determinant; 0.05-200 nm factor Va; 30-500 micro M phospholipids (PL); test inhibitor (A) in buffer of pH 7-9, containing 1-10 nm calcium ions but no calcium-chelating agent; (b) initiating catalytic cleavage of (S) by adding an aliquot of factor Xa (to final concentration 0.05-200 nm) so that there is an excess of Va over Xa, forming a S/(I) complex; (c) withdrawing aliquots of the
                                                                                                                                                                                                                                                                                                                                                     Gaps
                                              The present peptide comprises a thrombin-derived peptide, TP508, that includes a thrombin receptor binding domain sequence (see also AAM50856) and a serine esterase conserved sequence (see also eardiectissue repetide is used in a claimed method for promoting cardiac tissue repair. It is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. The thrombin derivative peptide is also used in claimed methods of stimulating revascularisation, stimulating vascular endothelial cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exosite assay for agents that inhibit catalytic cleavage of prothrombin - at sites away from the active site of prothrombinase, also new inhibitors, potentially useful as anticoagulants
                                                                                                                                                                                                   proliferation, inhibiting vascular occlusion, and inhibiting restenosis following balloon angioplasty, in which case it may be coated onto the catheter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prothrombin; exosite assay; anticoagulant; blood clot; thrombin; cardiovascular disease; stroke; haematological disorder.

```

```
reaction mixture, quenching them; and (d) assaying for concentration of Th. Alternatively, in the initial solution S is replaced by the same concentration of Xa (less than the amount of Va), and reaction is started by adding S. Also described in the present invention are inhibitors (A') had having 1650 less than 1 mu M identified by this assay. (A') are potentially useful as a new class of anticoagulants for treatment of cardiovascular disease, stroke and haematological disorders. The method substrate specificity in catalytic formation of Th. The present sequence represents human zeta 2 prethrombin 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prothrombin mutants having one or more changes in amino acid sequence compared with the natural protein and having 0-10% (preferably 0-0.25% of the activity of the natural protein are claimed, provided that the changes in amino acid sequence do not affect the capacity of the mutants to bind to specific ligands and receptors. The mutants have greatly reduced clotting activity and are useful as antagonists of thrombin inhibitors such as hirudin, hepsin and anti-thrombin III. The mutations may also result in changes to the in vivo half-life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prothrombin; mutant; mutein; platelet aggregation; blood clotting; coagulation; reduce; decrease; hirudin; heparin; anti-thrombin III; antagonist; D99N.

                                                                                                                                                                                                                                ö
prothrombin. The half-life may be reduced to less than 10 minutes the mutant prothrombin may have an extended half-life of more than
                                                                                                                                                                                                                              Gaps
                     1 hour, making it useful as an anticoagulant and to inhibit side-
effects of anti-coagulant treatment. They are converted to inactive
thrombin and are able to compete with native, active thrombin for
blinding to receptors. The present sequence represents the thrombin
mutant which is derived by trypsin cleavage of a specifically
claimed human prothrombin mutant in which Asp at position 419 is
changed to Asn. The thrombin Asn99 mutant was found to have only
0.24% of the activity of wild-type thrombin on a chromogenic
                                                                                                                               (Note: This sequence does not appear in the specification and has been produced by modifying the wild-type sequence of human prothrombin which appears in figure 1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence reresents wild-type (reference) thrombin. Mutants of this sequence (AAR7476-80 and AAR76033-41) have at least 80% monology with thrombin, and are capable of protein-c activation without significant fibrinogen clotting activity, and vice versa (specifically have a ratio of protein-c activity to fibrinogen clotting activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to
                                                                                                                                                                                                                                ö

The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rnrombin derivs with segregated pro- and anticoagulant activities
useful for treating thrombotic disorders but also diagnosis,
treatment of tumours, etc.
                                                                                                                                                                       mutagenesis; procoagulant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis, treatment of tumours, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;;

Protein

```
The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombin; oligonucleotide-directed mutagenesis; procoagulant; anticoagulant; protein engineering; ss.

The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.

Thrombin derivs with segregated pro- and anticoagulant activities ruseful for treating thrombotic disorders but also diagnosis, provided for thrombotic segment for mutant thrombotic segment for mutagenesis, has at least 80% homology with thromboth, and is capable of protein-C activation without significant fibrinogen conting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin of a produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.

Patent No. US20020032314A1

Patent No. US20020032314A1

APPLICANT: CAREY, DARRELL H.

APPLICANT: RAMMKRISHNAN, SHYAM

TITLE OF INVENTION: SYNTHETIC PEPTIDE NEUTROPHIL CELL CHEMOTACTIC AGENTS

TITLE OF INVENTION: SYNTHETIC PEPTIDE NEUTROPHIL CELL CHEMOTACTIC AGENTS

CURRENT APPLICATION NUMBER: US/09/777,328

CURRENT FILING DATE: 2001-02-05

PRIOR APPLICATION NUMBER: 08/330,594

PRIOR FILING DATE: 1994-10-28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

H42696
thrombin (EC 3.4.21.5) B chain - white sturgeon (fragment)
C; Species: Acipenser transmontanus (white sturgeon)
C; Date: 26-May-1994 #sequence_revision 26-May-1994 #text_change 17-Mar-1999
C; Accession: H42696
N; Banfield, D.K.; Macdillivray, R.T.A.
Proc. Natl. Acad. Sci. U.S.A. 89, 2779-2783, 1992
A; Title: Partial characterization of vertebrate prothrombin cDNAs: amplification and A; Reference number: A42696; MUID:92212913; PMID:1557883
A; Accession: H42696
A; Status: preliminary; nucleic acid sequence not shown; not compared with conceptual A; Molecule type: mRNA
A; Molecule type: mRNA
A; Across: references: GB MB1399
A; Cross: references: GB
